

Profile

Jordan Salazar

Full time Webmagician, part time human being

I'm a 27 year old webdeveloper living in Amsterdam, born in the US.
Looking to work freelance, build awesome products and utilise all the
modern tools available.

Born: 31-10-1992

Phone: +31(0)639759056

Email: contact@jrsalazardev

Skillset

I'm a driven craftsman, specialised in architecting and developing products from concept to MVP and beyond. Future-proofing projects with the best practices of today such as Automated Testing (BDD/TDD), Continuous Integration, Continuous Delivery and Infrastructure Monitoring. With a passion for finding the right tools for the job.

Primary skills

Orchestrating and developing advanced web applications and (micro-)services (Laravel, Node.js)

Creating and connecting separate software systems through API's and managing data flows (REST, GraphQL, Web/Sockets, SOAP)

Engineering next-gen user interfaces with Javascript and modern web technologies. (ES2020, React, Redux, Vue, Vuex, CSS-in-JS, SCSS)

Developing and maintaining cross platform mobile apps (React Native, Ionic)

Setting up professional engineering pipelines (Bash, Docker, CI, CD, Puppet)

Languages & Frameworks

Javascript

React, Redux, Vue, Vuex, Angular.js, Angular, RxJS, Express, Hapi

JS is my oldest friend and the go-to language for anything general purpose. Started my career using Angular.js and SCSS, these days I'm all about component based architectures, unidirectional data flow and CSS-in-JS.

On the server I've set up microservices and monoliths. REST API's and socket based messaging endpoints. Written scripts to combine and manage frontend assets (pre-webpack) and developed things as a video-overlay generator with node-ffmpeg.

CSS

Emotion, styled-components, SCSS

Whether you're building static pages or component based javascript apps, CSS is an essential player. Mastered most of its inter-browser quirks, animation based complexities and best practices for setting up and managing large amounts of css.

PHP: Hypertext Preprocessor

Laravel, Symfony, PHPUnit, DependencyInjection

PHP (Namely Laravel) is the first choice for cut and clear web applications where an opinionated framework is the first choice. Intimate with Laravel's best practices and feature rich ecosystem.

GNU + Linux

ArchLinux, Debian, Alpine, bash, zsh, fish, Docker, Git, Vim

Full time GNU + Linux user for 3-4 years. When working with thousands of text files, libraries and packages, there's no better environment to do what you need. Confident writing deploy scripts, managing multiple servers and debugging system related issues.

∞ Timeline

12-2019 – Present

jrsalazar.dev

Freelance Developer

Business owner gone digital mercenary. Back on the saddle and looking to go head first into the greater technical challenges of tomorrow.

04-2016 – 12-2019

Cirkel

Lead Developer

Took the plunge into business culture and started running projects as a 2 man agency. Main achievement was building a Laravel system + React Native app to digitise 10000km² of inventory and forward the database to their Magento webshop and beyond.

01-2015 – 04-2016

NoProtocol

Fullstack Webdeveloper

NoProtocol kickstarted my career and gave me the opportunity to develop my skills. Functioned mainly as fullstack developer and occasional frontend wizard. Worked on projects for Honor europe, AirMiles, Coca-cola & more.

06-2014 – 12-2014

Bored of Advisors

Developer Internship

Prototyped a titanium app, programmed a robot arm and built a few simple frontends in Angular.js, sorry Thijmen.

2013 – 2014

Amsterdam University of Applied Sciences

Software engineering

Learned how to work Agile™, got my webdev-feet wet building a RoR app and got out before I was stuck building enterprise Java servlets for eternity.
